functionality

The gPROMS platform
Equation-oriented modelling & solution engine

* Primarily used internally by PSE for delivery of services

- v4.0.0 – April 2014
- v4.1.0 – June 2015
- v4.2.0 – December 2015
- **v4.3.0 – September 2016**
- **v4.4.0 – Q1/2017**

gPROMS platform v4.3

Highlights – process modelling

- Global System Analysis
 - new type of gPROMS activity
- A major new capability
 - applicable immediately to all gPROMS models
- New directions in
 - gPROMS computations
 - interactive results management

Presentation this morning

■ New **DAEBDF integrator** now usable for all activities

- Used for Simulation since v4.2.0
 - ➔ significant improvements in speed & robustness
- Now available for Parameter Estimation & Optimisation
 - Efficient computation of 1st-order sensitivities

■ New **parallelized Parameter Estimation** solver

- Parallel evaluation of multiple experiments
- Suitable for execution on multicore machines
 - 4-core machine ➔ 2.7× acceleration
 - 12-core machine ➔ 7× acceleration
- Straightforward use with existing parameter estimation problems

SOLUTION PARAMETERS

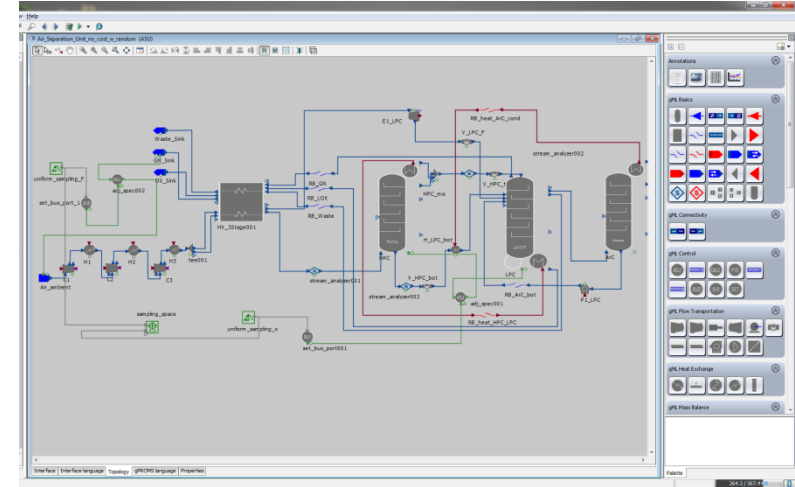

```
PESolver := "MAXLKHD" [... "ParallelProcessing" := TRUE, ...];
```

- **Units of Measurement** support in all activities
 - Simulation, parameter estimation, optimisation
 - Activity editors & result reports

- More extensive support for “friendly names” for parameters & variables visible to end-users across GUI
 - instead of long pathnames...

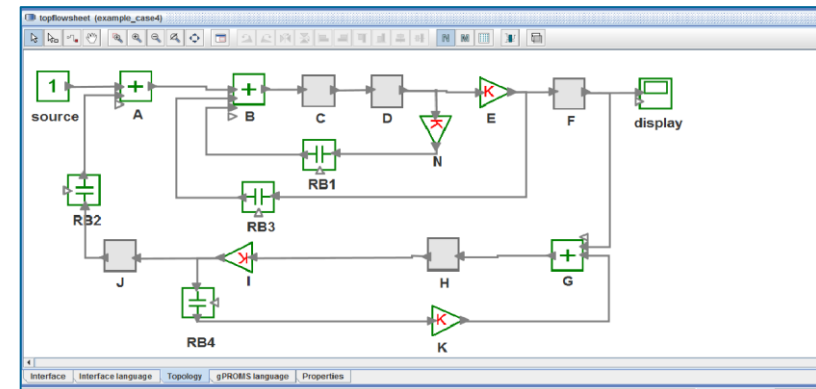

■ Model pruning during MIP execution

- Automatically identify & remove all equations/variables not needed during MIP
 - To be post-solved after converged solution is obtained
- Model Pruning concept & implementation already tested extensively in the context of gPROMS dynamic simulations
 - ➔ Significant enhancement in robustness & speed of solution

■ Automatic sequencing algorithm for multiple recycle closure

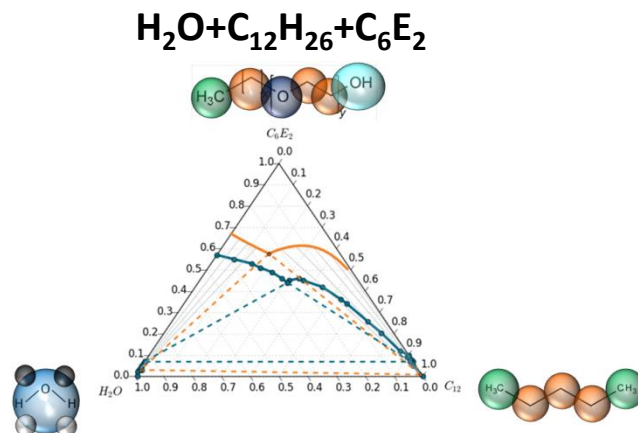

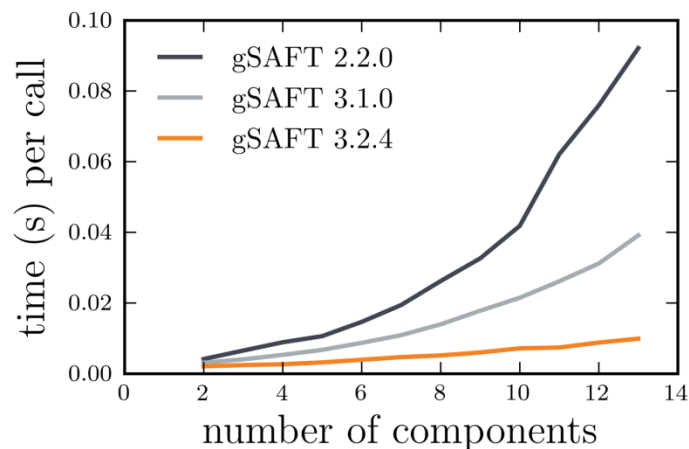

- No need for user to specify order in which recycles need to be handled
- Can handle flowsheets of arbitrary complexity

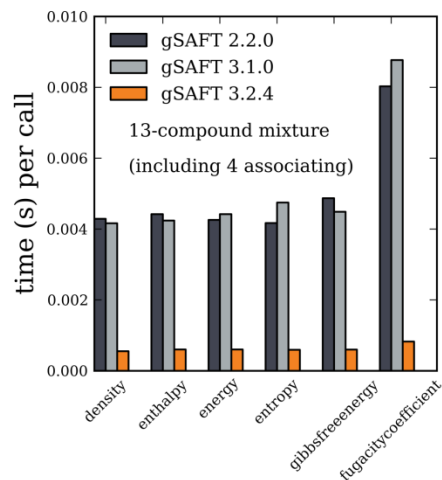

gPROMS platform v4.3

Highlights – materials modelling

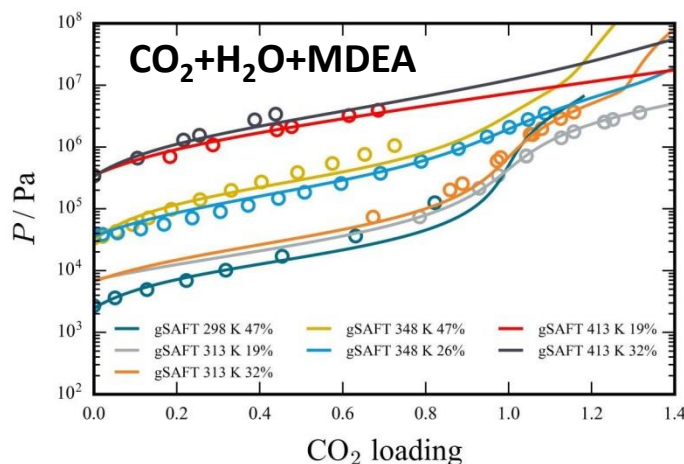

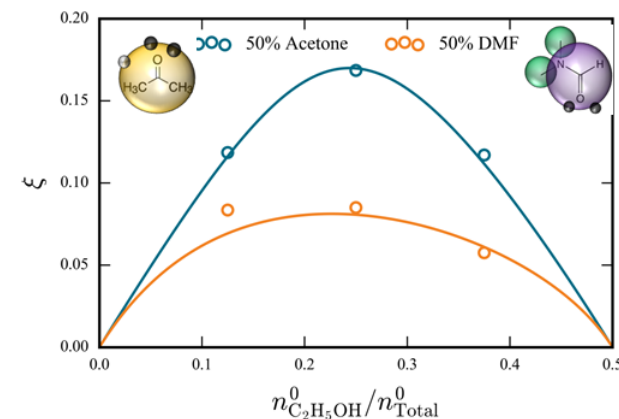

3. Predictive modelling of systems with solid phases

1. Order-of-magnitude performance improvements

2. Accurate/predictive modelling of increasingly complex systems

4. Predictive modelling of reactive systems

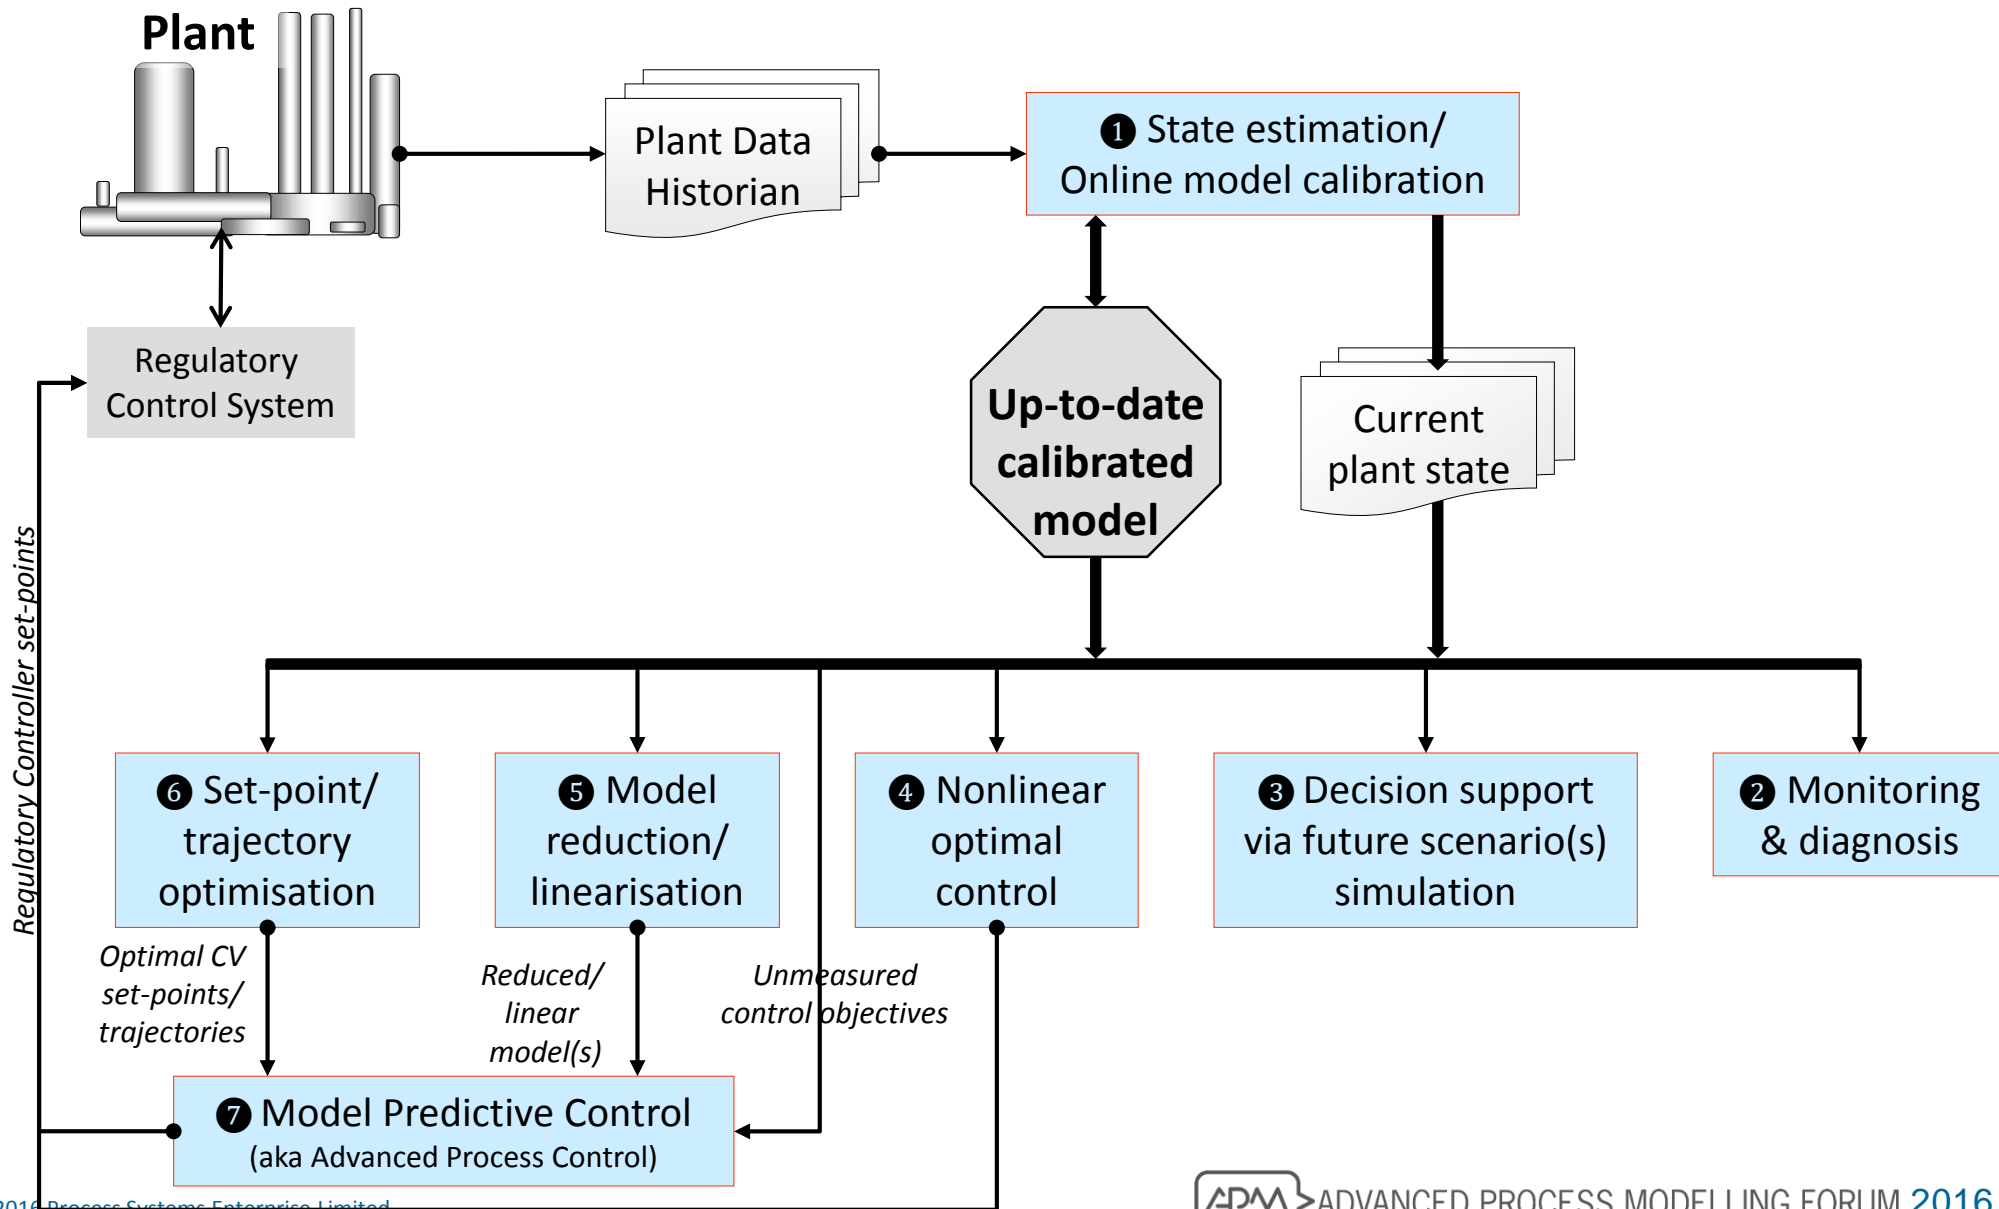

gPROMS platform v4.3

Supporting online model-based applications

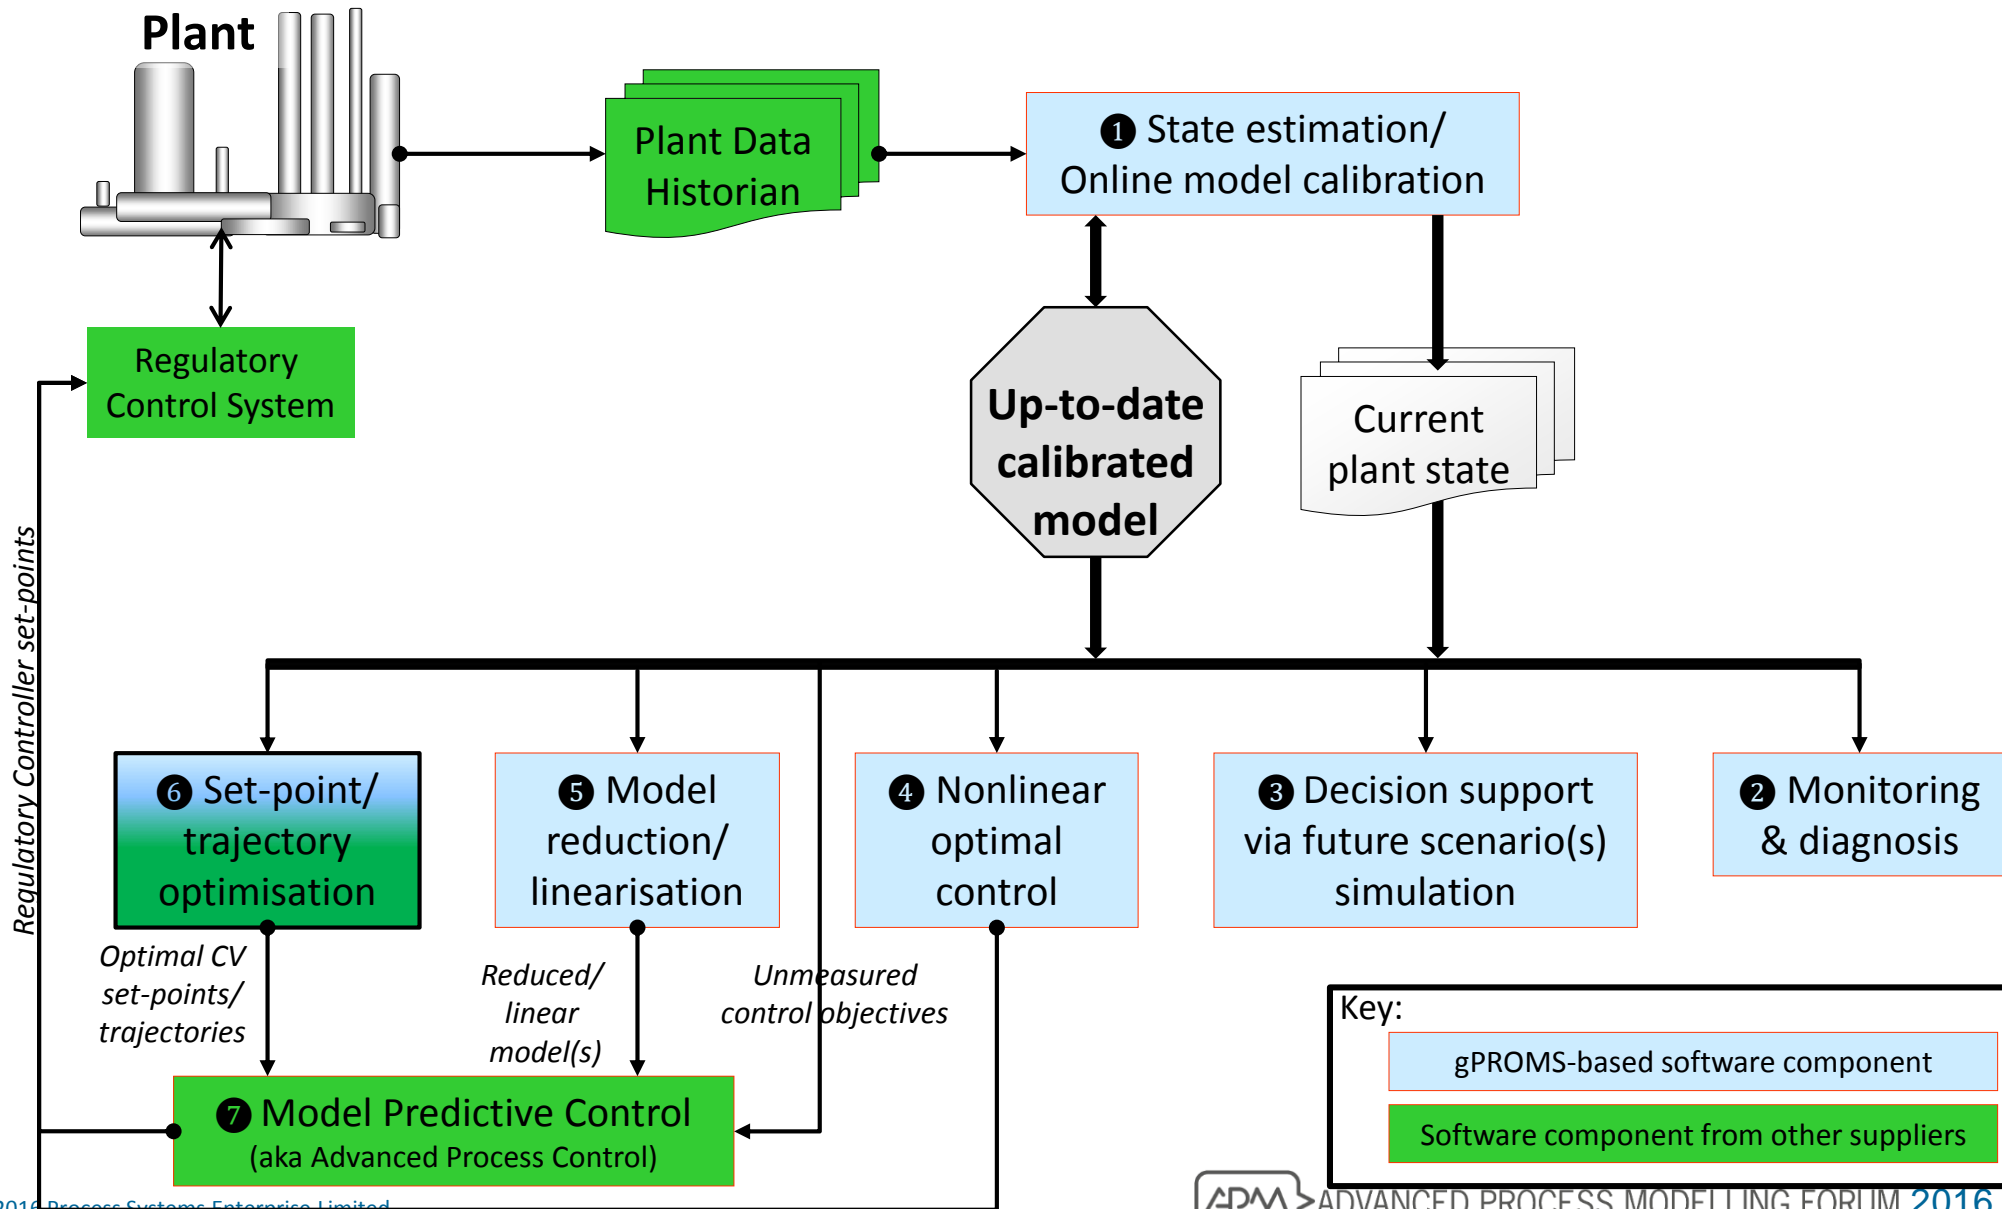

Online Model-Based Applications (OMBAs)

Integrated framework

Online Model-Based Applications (OMBAs)

Integrated framework

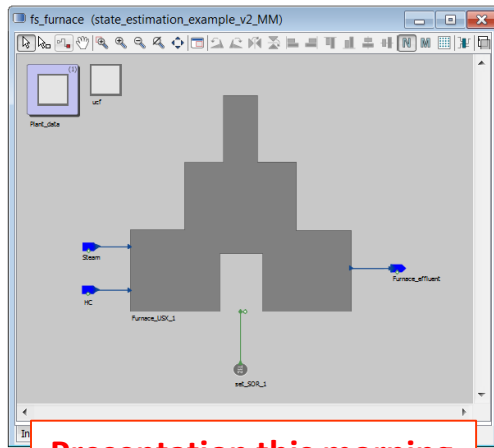

Online Model-Based Applications (OMBAs)

Examples

gCRACKER Online

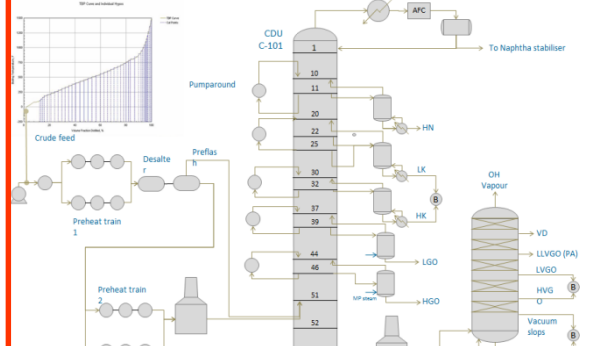

Olefin cracking furnace monitoring

Presentation this morning

ARRMO

Advanced Real-time Refinery
Monitoring & Optimisation

Presentation this afternoon

3 other OMBAs
under
development

- Each OMBA involves one or more gPROMS-based computations...
 - makes use of gPROMS model constructed, validated & tested offline
 - communicates with the gPROMS solution engine to perform calculations
- Each OMBA has a different software architecture...
 - ...but makes use of common software elements

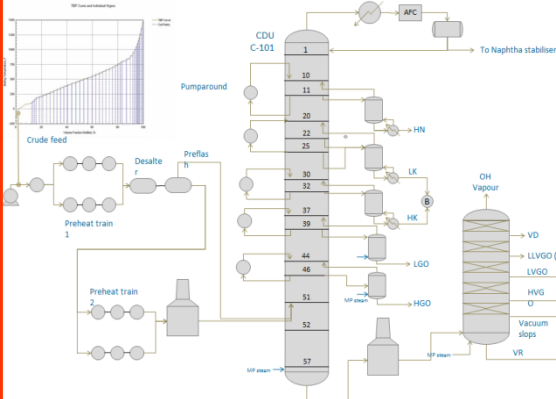

Online Model-Based Applications (OMBAs)

Real-time data
connectivity
(OPC)

Real-time
State Estimation
technology

Model configured, validated, tested in
/exported in encrypted form
from any gPROMS family product

gPROMS-based
computations

Current focus: full productisation of State Estimation technology

- Packaged as stand-alone gPROMS-based Application (gBA)
- Direct data I/O via OPC interface
- v1.0: Extended Kalman Filter (EKF) algorithm
 - Make use of new DAEBDF integrator

Real-time data connectivity (OPC)

gPROMS platform beyond v4.3

1. Streamlined workflows

- Flowsheeting
- Relating models to experimental R&D
- Facilitating model deployment within the organisation

2. High-Performance Computing platforms

- Increased range of gPROMS algorithms taking advantage of HPC

3. Materials modelling

- Solids
- Electrolytes
- Reactive systems

4. Online Model-Based Applications

- Bringing the benefits of Advanced Process Modelling to process operations

Thank you
